

Attribute Mapping

By default, Wise2Sync maps main product information like brand, manufacturer, price, stock level etc. However, additional product information like delivery terms, weight, dimensions etc. can be useful in your export as well. In this article, we will explain how to map these attributes so this data can be used in export profiles.

Step 1. Create a desired attributes list

Navigate to Data mapping → Attribute mapper → My attributes. Here you will see a list of already mapped attributes. Click "Add attribute" and a pop-up will open:

- Attribute code - unique identifier (ID, code, or any other value, that can be used for import in your sales platform). You can make this the same as Label.
- Label - usually a text value, the name of the Attribute you will see in export profiles
- Type - choose "Text" for text type values (for e.g. "3-5 days", "Coming soon"), or "Number" for numeric values (for e.g. 9.000)

The screenshot shows the 'Create New Attribute' modal in the Wise XML interface. The modal contains the following fields:

- Attribute code:** A text input field containing the value 'weight'.
- Label:** A text input field containing the value 'Weight'.
- Type:** A dropdown menu currently set to 'text'.

At the bottom of the modal are two buttons: 'Cancel' and 'Create'.

In the background, the 'My attributes' table is visible. It has columns for 'ID', 'Type', and 'Actions'. The 'Add Attribute' button in the top right corner of the table is highlighted with a red box.

After you click "Create" a new attribute will be saved. Repeat this step for all desired attributes.

Step 2. Map attributes

Navigate to Data mapping → Attribute mapper → Supplier attributes where you will see all possible product attributes from your suppliers / data feeds. Column alias shows the connection between supplier attributes and your attributes. Notice the price, stock etc. are already mapped.

Use a search field to find the desired attribute and click the Edit icon in the corresponding row. A pop-up will open. Use "Alias" field to find an attribute you created in Step 1.

Another way of mapping attributes is to do it straight in Product Preview. Navigate to Product Preview and press the Inspect Product button on the right. A window with all the attributes that the product has will open.

Do not forget to follow Step 1 of this article to create your attributes first.
